## CLAIMS

Please amend Claims 1, 2, and 8-14 as follows:

1. (Currently Amended) A power pricing plan rack equipment control method comprising:

establishing a power pricing plan for operating rack equipment; and controlling operation of said rack equipment in accordance with said power pricing plan, wherein said power pricing plan enables said rack equipment to provide more power to a higher priority processing activity while providing less power to a lower priority processing activity.

- 2. (Currently Amended) The method of claim 1, wherein controlling said operation includes [[said]] rack equipment performance settings.
- 3. (Original) The method of claim 1, wherein controlling said operation includes changing power consumption by said rack equipment in accordance with said power pricing plan.
- (Original) The method of claim 3, wherein said power plan indicates a reduction in a voltage and a frequency of said rack equipment when a price for power increases.
- 5 (Original) The method of claim 3, wherein said power plan indicates an increase in a voltage and a frequency of said equipment when a price for power decreases
- (Original) The method of claim 1, wherein said controlling said operation comprises automatically adjusting said performance interactively.
- 7. (Original) The method of claim 1, further comprising: receiving an indication of power pricing change; and analyzing correspondence of said power pricing change to performance control instructions included in said power pricing plan.
- (Currently Amended) An computer-useable storage medium comprising computer-readable program code embodied therein for causing a

Serial No. 10/801,247

Art Unit 2116 Examiner: Flamin, Abdelmoniem - 2 -200208443-1 computer system to implement a execute power pricing performance instructions comprisina:

- a power pricing detection module for detecting indications of power pricing fluctuations covered by a power pricing plan;
- a power pricing plan policy module for ascertaining power pricing plan instructions associated with said power pricing fluctuations; and
- an instruction generation module for generating rack equipment performance adjustment commands to implement said power pricing plan instructions, wherein said power pricing plan enables providing more power to a higher priority processing activity while providing less power to a lower priority processing activity.
- (Currently Amended) The computer-useable storage medium of claim 8, further comprising computer executable instructions for a telemetry monitoring module for monitoring characteristics and activity of rack equipment associated with said adjustments commands.
- 10 (Currently Amended) The computer-useable storage medium of claim 8, further comprising computer executable instructions for a power pricing event spawning module for generating power pricing events.
- 11 (Currently Amended) The computer-useable storage medium of claim 8, wherein said instruction generation module further comprises computer executable instructions for functionality for generating a command to postpone processing.
- 12 (Currently Amended) The computer-useable storage medium of claim 8, wherein said power pricing plan information comprises computer executable instructions that when executed enable [[is]] an agreement between a host and a client and said instructions enable said power pricing information plan to be [[is]] structured in a manner to accommodate business activities of said client.
- (Currently Amended) The computer-useable storage medium of claim 13. 9, wherein said telemetry monitoring module [[also]] further comprises computer executable instructions for [[confirms]] confirming said performance adjustments commands are complied with.

Serial No. 10/801,247

Art Unit 2116 Examiner: Elamin, Abdelmoniem - 3 -200208443-1

 (Currently Amended) A power pricing rack equipment control system comprising:

rack equipment for processing data:

a power pricing plan component for controlling said rack equipment based on a power pricing plan policy, wherein said power pricing plan enables said rack equipment to provide more power to a higher priority processing activity while providing less power to a lower priority processing activity; and

a communications bus for coupling said <u>rack</u> equipment and said power pricing plan control component, wherein said communications bus is utilized for communicating information between said power pricing plan control component and said rack equipment.

- (Original) The power pricing rack equipment control system of claim
  wherein said power pricing plan component is operable to modulate power consumed by said rack equipment in accordance with said power pricing plan.
- (Original) The power pricing rack equipment control system of claim
  wherein said power pricing plan component is operable to switch on and off said rack equipment in accordance with said power pricing plan.
- (Original) The power pricing rack equipment control system of claim
  further comprising a master management control center for coordinating control of rack equipment among a plurality of racks.
- (Original) The power pricing rack equipment control system of claim
  wherein said power pricing plan policy is dynamically adjustable on the fly.
- (Original) The power pricing rack equipment control system of claim
  wherein said power pricing plan policy is structured in accordance with business needs of a client.
- (Original) The power pricing rack equipment control system of claim14, further comprising:

a memory for storing equipment information and power pricing plan policy information; and
